FEDERAL - STATE COOPERATIVE

SNOW SURVEYS AND IRRIGATION WATER FORECASTS

for

Platte and Arkansas Drainage Basins

By
Division of Irrigation, Soil Conservation Service
United States Department of Agriculture
and
Colorado Agricultural Experiment Station

Data included in this report were obtained by the agencies named above in cooperation with the U. S. Forest Service, National Park Service, State Engineer of Colorado, Wyoming and New Mexico and other Federal, State and local organizations.

As of
FEB. 1, 1953

UNITED STATES DEPARTMENT OF AGRICULTURE
SOIL CONSERVATION SERVICE

TO RECIPIENTS OF COOPERATIVE SNOW SURVEY
AND WATER SUPPLY FORECAST REPORTS:

Forecasts by U. S. Weather Bureau of total annual streamflow October-September, inclusive, at more than 300 gaging stations are issued monthly January through May in the publication WATER SUPPLY FORECASTS FOR THE WESTERN UNITED STATES.

Weather Bureau forecasts of runoff presented in this bulletin are computed from procedures based on mathematical analysis of the relation between precipitation and runoff.

The Weather Bureau bulletins may be secured by writing to:

Hydrologist in Charge
River Forecast Center
U. S. Weather Bureau
712 Federal Office Building
Kansas City 6, Missouri

FEDERAL-STATE COOPERATIVE
SNOW SURVEYS AND IRRIGATION
WATER SUPPLY FORECASTS

FOR

PLATTE-ARKANSAS RIVER BASINS

February 1, 1953

Report Prepared

by

Homer J. Stockwell, Snow Survey Leader
Fort Collins, Colorado

Division of Irrigation
Soil Conservation Service
Colorado Experiment Station
Fort Collins, Colorado

General Series Paper No. 532
Colorado Agricultural Experiment Station

WATER SUPPLY OUTLOOK
PLATTE-ARKANSAS DRAINAGE BASIN
FEBRUARY 1, 1953

Seasonal snow accumulation on the headwaters of the North and South Platte and Arkansas rivers is from 70 to 95 percent of normal as of February 1. Stream flow during the 1953 snow-melt season will probably be less than indicated by snow measurements because of the extreme deficiency of precipitation in the high mountain areas during the late summer and fall months, particularly September and October. Snow at medium and lower mountain elevations is much less than normal or non-existent. The summer season runoff on all streams will be much less than for the 1952 season. Soil moisture conditions are reported as fair to poor in much of the irrigation areas with the exceptions of the Sterling district in Colorado and in Nebraska.

CHEYENNE RIVER

Snow cover in the Black Hills of South Dakota is slightly above normal for this date. Precipitation has been deficient for several months at valley elevations and soil moisture conditions are described as poor. Stream flow is below average. Storage in Belle Fourche reservoir is 44,500 acre-feet as compared to 72,000 on February 1, 1952 and well below average.

NORTH PLATTE RIVER

The seasonal snow accumulation to date is definitely in contrast to a year ago. The overall average snow water content is now 78 percent of normal as compared to 150 percent last year on this date. On the Sweetwater river drainage the snow cover is near average. The seasonal runoff of the North Platte into Seminoe Reservoir will be reduced by very dry mountain soils regardless of late season snow. As in other areas, precipitation in the late summer and fall months was extremely deficient. There is no snow reported at lower elevations or in the foothills. The irrigation water supply for 1953 below Pathfinder Reservoir is assured because of high carry-over storage made available by relatively heavy stream flow the past four years and especially 1952. The four major reservoirs were near capacity at the peak of the snow melt season, but the irrigation water demand was unusually high all the summer of 1952. Total storage is now 1,600,000 acre-feet which is near that storage last year at this time. Soil moisture conditions are reported as fair to poor on irrigated areas throughout the valley with some improvement noted in western Nebraska. Stream flow is below normal in Colorado and Wyoming and slightly above normal in Nebraska.

On the Laramie river the snow cover is similar to the North Platte with summer runoff expected to be below average. Soil moisture conditions near Laramie and Wheatland are reported as poor. Storage in Wheatland reservoir is 24,000 acre-feet as compared to 52,000 on February 1, 1952.

WATER CONTENT OF SNOW ON THE WATERSHEDS OF PLATTE, ARKANSAS, UPPER COLORADO AND RIO GRANDE BASINS BASED ON SNOW SURVEYS MADE APPROXIMATELY FIRST DAY OF MONTH

In Percent of Normal
